

What do I need to know about Johnson & Johnson's Janssen COVID-19 Vaccine (J&J/Janssen) now?

There is a risk of a rare but serious condition involving blood clots and low platelets in people after receiving the J&J/Janssen COVID-19 Vaccine. **This risk is very low.**

This problem is rare and happened in about 7 per 1 million vaccinated women between 18 and 49 years old.

For women 50 years and older and men of any age, this problem is even more rare.

This problem has not been linked to the other two COVID-19 vaccines (Pfizer-BioNTech and Moderna).

SHOULD I STILL GET VACCINATED with this or other vaccines to protect against COVID-19?

YES, experts agree that all COVID-19 vaccines help prevent COVID-19 disease, especially severe illness and death.

The known and potential benefits of all COVID-19 vaccines outweigh the known and potential risks. You need only one dose of the J&J/Janssen vaccine. You need two doses of the other two vaccines (Pfizer-BioNTech and Moderna).

What if I already got the J&J/Janssen COVID-19 Vaccine?

For three weeks after getting the J&J/Janssen vaccine, you should watch for possible symptoms of a blood clot with low platelets, like:

- Severe headache or blurred vision
- Shortness of breath
- Chest pain
- Leg swelling
- Gut pain that does not go away
- Easy bruising or tiny blood spots under the skin

Get medical care right away if you develop any of these symptoms.
